TRUSTED SOLUTIONS

vulnerability assessment • penetration testing • intrusion detection • incident response

cuproprotectTM

the most trusted name in credit union security

CUPROTECTTM services are utilized by most of the larger corporate credit unions, as well as natural person credit unions of all sizes. Our security team will work to create a comprehensive solution that focuses on strengthening your security posture, transferring knowledge to your staff, and meeting your budget needs.

Vulnerability Assessments

A Vulnerability Assessment is a testing service that is designed to find security weaknesses in an organizations network.

CUPROTECTTM Vulnerability

Assessments feature our superior service methodology (developed by MicroSolved, Inc. for use in top-secret government networks), and our unique Distributed Assessment Platform (DAP). MSI's DAP technology finds more vulnerabilities than any similar service, and removes many "false positives" that can lead to confusion.

CUPROTECTTM security experts are more manually involved in your assessment service than any other service available. From results verification to reporting, our experts provide you with a superior level of service.

Your Vulnerability Assessment includes delivery of a comprehensive report at service conclusion. This report is broken into 2 parts, an executive summary, and a technical details report. The executive summary quantifies risks in a visual manner that is easy for a non-technical reader to understand. The technical details report explains the vulnerability, and includes the necessary mitigation strategy to eliminate the security risk.

Vulnerability Assessment Options

Include:

- > External Vulnerability Assessments
- > Internal Vulnerability Assessments
- > Managed Vulnerability Assessments

Penetration Testing

CUPROTECTTM Penetration Testing service is designed to help you understand the real business impact of your information security posture and practices.

During a CUPROTECTTM Penetration Test, our information security experts "attack" your network in the same manner a "hacker" or someone with malicious intent would.

If access to systems is obtained, the CUPROTECTTM team will continue to leverage that access to delve deeper and deeper into the infrastructure of the site. The team will map, document, and exploit resources exposed to them as they focus on the very core of the organization.

Each step of the penetration testing process is handled with the utmost care for the client's systems and their data. CUPROTECTTM offers very granular service options, allowing you to define attack strength and out-of-bounds areas as you see fit. The CUPROTECTTM team keeps you continually advised as to the status of the exercise and you are free to stop the exercise at any point.

At the conclusion of your CUPROTECTTM Penetration Test, you will receive a detailed report with three parts: an executive summary that quantifies business risk for non-technical readers (suitable for use as a board report), a technical manager's report that discusses the technical cause of the risk, and a technical details report that suggests mitigation strategies right down to the "point here and click there" level of detail. Furthermore, reporting can include a "Gap Analysis" section that discuss how your network needs to address the standards or regulatory issues particular to your organization (i.e. GLBA, ISO 17799, NCUA 748, etc...).

Incident Response Services

CUPROTECTTM features fast, effective response to information security incidents. We can provide expert diagnosis, technical assistance, and other services to assist you in your time of need. CUPROTECTTM team members are able to operate as your full Incident Response Team (IRT) or provide IRT staff augmentation.

Monitoring Services

CUPROTECTTM Monitoring services help your organization detect and quickly respond to network attacks. CUPROTECTTM security experts monitor your network devices and traffic, alerting you when our experts recognize a possible attack and assisting you in defending the attack and maintaining business continuity. CUPROTECTTM monitoring is as comprehensive or selective as you wish, allowing us to monitor the network as a whole or to accept the responsibility for key network devices.

CUPROTECTTM Monitoring can include:

- > Network Intrusion Detection Systems
- > Host Intrusion Detection Systems
- > Firewalls
- > VPN connections

Policy Services

One of the foundations of organizational security is a strong information security policy. CUPROTECTTM security experts have authored numerous security policies for various organizations with diverse business risks. CUPROTECTTM services also include policy review services that examine your current policies with consideration to legislative or standards pressures your IT infrastructure may face – pressures like NCUA Section 748 Guidelines, Graham-Leach-Bliley Act (GLBA), or ISO 17799.
